Overview

Business and IT managers continue to look for ways to optimise staffing, increase efficiencies and maximise skill sets but at the same time reduce business costs. Individuals are expected to quickly adapt to changing business requirements, to collaborate better with their peers and business partners, and take on new responsibilities that may cross departmental lines.

Guaranteed access to the company's corporate knowledge, fail-proof processing of business communications and intelligent forms/work-flows are all intrinsic components of achieving these objectives.

IntraLogic helps our customers work better by providing a single, standardized point of knowledge and process automation which extends to every staff member, remote office, subcontractor or customer.

We are pleased to announce the immediate availability of Weblogics latest flagship Portal solutions, IntraLogic Version 8 and IntraLogic Enterprise Version 8. **In a nutshell, IntraLogic Version 8 takes business management to new levels and sets new standards in design and usability.**

From a single portal, any business from small SMEs to large multi-nationals now have the most complete business productivity system addressing all their needs. By providing Document Management and revision control, Intelligent forms management, comprehensive workflow, and out-of-the box collaboration and communication tools, IntraLogic Version 8 will change the way people communicate and operate.

In line with IntraLogic product philosophy, Version 8 operates out of the box. It requires no programming, no development, no need to tie up your IT department with months of development and never-ending change requests. It installs into any IT environment, uses standard MS SQL Data Base, and customises to your

business using easy but powerful point-and-click building tools.

Availability:

The production release is IntraLogic Version 8.1 and it is generally available from 1st April 2009. To arrange shipment and installation please contact Michael Hargreaves on 02 9929 0777.

IntraLogic Version 8.1 is a no-charge upgrade for all existing customers currently under software maintenance and all Software-as-a-Service (SaaS) clients. Customers who are not covered under a current maintenance agreement and who wish to upgrade, please contact Jonathan Harris at Weblogics (02 9929 0777).

IntraLogic Enterprise Version 8 operates under ColdFusion Enterprise

Version 8, providing additional support and features suited to larger enterprise-wide architectures (see below) and requires additional costs.

The installation process requires changes to the database and should be carried out by Weblogics in conjunction with the customer's IT staff. Individual SaaS customers will be upgraded in a time frame that suits their business.

Product Highlights:

IntraLogic Version 8.1 is a new, feature-rich version providing on-going evolutionary progression from Version 7. Version 7 introduced many enterprise-wide capabilities, including major enhancements in workflow and forms, providing richer functionality and flexibility, broadening the user base and scalability particularly to larger clients requiring higher levels of sophistication.

IntraLogic Version 8.1 continues with this development path, however it now incorporates new underlying technology, called AJAX, itself a component of **Web 2.0**. Web 2.0 refers to a second generation of web development and design, that aims to facilitate communication, secure information sharing, interoperability, and collaboration on the World Wide Web.

AJAX technology: IntraLogic Version 8.1 has been redeveloped and enhanced using Asynchronous Javascript and XML, or AJAX, the

Release Notes

most advanced Web development environment today.

Increase in performance: AJAX provides a newer, crisper interface combined with faster performance and more flexible customisation. It uses Javascript functions on the client PC to perform tasks that would previously be carried out on the server. This means that overall performance is enhanced because computer load is distributed across the server as well as the client PC. It is expected that end-user performance will increase from 10% in small sites to 25-30% in larger enterprises (1000+ concurrent users), depending on the tasks being performed.

AJAX look and feel: The new look and feel is ultramodern. Weblogics made the decision to work with professional designers throughout the software design phase. The result is increased usability and a better user experience. Ease of use, flexibility and customisability have now reached new levels.

AJAX technology allows extensive use of new-look grids which are more compact, stylish and provide faster paging.

Improved Search functionality: 'search' now accepts Google type boolean predicates such as AND and OR, along with apostrophes for 'group' searches. Searching is now faster and results only include the documents you want to see.

Drag and Drop containers: Users already have the option of selecting one of many standard templates to define their portal layout. Now each 'component' of information displayed on page is held in a discrete 'container'. Users can now click on a container and drop it to another location of the page. Drag and drop provides unlimited flexibility for users wanting to customise their screen layout.

Pop-up 'filter as you type' filters: IntraLogic Version 8.1 makes extensive use of AJAX to allow letter-by-letter filtering of information as users type into a search box. This saves time and processing. The same feature is used when sifting through a list of actioners when approving documents and forms, or when searching for communities.

Document Type Workflows: In IntraLogic Version 8.1, the administrator can attach a workflow to a document type. This means when a document is saved and the user clicks on the relevant document type, it will be automatically directed to the approver responsible for that document type. E.g. documents relating to HR can be automatically approved by the HR Manager, whereas documents relating to corporate governance may be directed to the Co. Secretary. For safety, the administrator can optionally provide a message confirming that the user has selected the correct document type prior to submission.

Release Notes

Return to Requester Workflow:

A new Workflow step – “Return to requester”, is now available and can be placed in a workflow.

'Reports to' in Escalations: The submitters 'reports to' can be an actioner in an escalation. This field is dynamic and it is not necessary to submit a user name.

Forms can now contain calculated fields: Calculated fields are fields that contain a value calculated via the mathematical calculation of 2 or more other fields. The calculation is carried out on the fly. E.g. if one field contains 'kilometres', and another field contains 'travel time', the form may contain a third field whose value 'average speed' is equal to 'kilometres/travel time'. The user uses excel type operators such as +, -, * and /.

Forms can now be auto-approved:

This is now a single step process when the submitter is the actioner. When the submitter appears in a further step, the form is auto-approved.

PDF Form printing: Users can now populate a PDF from a form during the workflow process.

New Events Calender: The events calendar has been revamped to provide better usability

***IntraLogic Enterprise:** Using the same base code set to provide the same end-user experience as IntraLogic Version 8, IntraLogic

Enterprise is compatible with ColdFusion's latest high-end web engine, ColdFusion Enterprise. It is designed primarily for customers with multiple servers, i.e. where database, document stores and web delivery takes place on separate computers, or where firewall technology prevents all processing taking place on a single computer. Enterprise also supports 64 bit architecture and multithreading, providing faster processing in very high load computer environments. In summary ColdFusion Enterprise provides:

- Full 64 bit architecture.
- Supports full multi-threading
- Support of Multiple Servers (from a single instance) and is therefore more scalable.
- Increase in Verity Search Engine domain space/indexing.

For further information on upgrading to IntraLogic Version 8 please call Michael Hargreaves on +61 2 9929 0777.
